

**CONTAINER FOR A FLOWABLE PRODUCT, PROCESS
OF MANUFACTURE AND THE USE THEREOF**

ABSTRACT

5 The present invention relates to a container for a flowable product, particularly for a beverage and, in particular, for still or sparkling mineral water. The container according to the invention includes a body having in a greater section a dimension d_1 and of at least one neck with an internal diameter d_2 which can be closed by a member for closing off and/or
10 of distributing the flowable product from the container. The wall or walls forming the body of the container are preferably made of a flexible plastic which can deform for constant surface area, particularly under the weight of the flowable product from the container when the wall or walls encounter a point or bearing surface, so as to form, at least locally, a non-planar wall
15 portion and wherein the ratio d_2 to d_1 is between 1:3 and 1:10.
